

COMPREHENSIVE CONCEPT MAP OF FACTORS AFFECTING SPATIAL RESOLUTION

Integrating Insights from Literature (Gonzalez & Woods, 2018; Sonka et al., 2014; Jensen, 2015; Nyquist, 1928)

LITERATURE REFERENCES

REF Point Spread Function (PSF): a system's response to a point source of light; its spread defines image blur. — Gonzalez & Woods (2018)

REF Nyquist-Shannon Sampling Theorem: sampling frequency must exceed twice the highest spatial frequency present to avoid aliasing. — Nyquist (1928)

REF Diffraction Limit: the Rayleigh criterion sets the minimum resolvable angular separation of two points. — Sonka et al. (2014)

REF Ground Sample Distance (GSD): the ground-projected size of one detector pixel; the primary resolution metric in remote sensing. — Jensen (2015)

REF Modulation Transfer Function (MTF): quantifies how well a system reproduces contrast as spatial frequency increases.
